Superstition — such as fondness for the numeral eight which sounds like prosper in Chinese — does play a role in real estate and in the stock market. Additionally, the data indicated that preference for lucky numbers might be seen as a "luxury", with the premium for units ending with a "lucky" eight higher in the more expensive part of Singapore.

The ‘lucky 8’ premium in housing unit prices

By SUMIT AGARWAL

It is not often that a business school professor gets to quote from a funk music legend, but let me begin with a few words from Stevie Wonder:

"When you believe in things that you don’t understand, then you suffer."

Supervision isn’t the way. Three lines from the 1972 hit "Superstition" sum up a common issue in many cultures. No matter how advanced and rational we might like to think we are, superstition is a practice that remains widespread and has an impact — often detrimental — on our economic lives.

Studies have shown, for example, that many people behave more cautiously when making financial decisions on Friday the 13th or any other day of the month.

Likewise, many commercial and residential buildings in the United States and other countries around the world do not have a 13th floor. Those that do may find they have to offer special discounts to entice tenants.

So we “suffer” — as Stevie Wonder suggests — financially and economically, as a result of superstition?

Even in countries ranked as highly educated, superstition persists and is often passed on to future generations that more rational people might believe that superstition brought about by education means they should be swept aside.

In Singapore, for example, ranked among the most highly educated societies in the world, the numbers eight and four still carry particular significance for many in the majority Chinese community. In Chinese culture, eight is traditionally believed to be lucky as it sounds similar to “prosperity”, while four — sounding like the word for “death” — is believed to be unlucky.

The Beijing Olympics was a prominent example of this, with the opening ceremony timed to kick off at precisely 8.09pm on the eighth of the eighth month, 2008.

Given the essential role of well-functioning asset markets in economic development, it is also important to gauge the impact, if any, that superstition has on those markets.

For example, if superstition affects market signals, the allocation of resources may be distorted, with negative implications for welfare and economic growth.

Our recent academic study, for example, examined initial public offerings (IPOs) on the Shenzen and Shanghai stock exchanges in China between 1991 and 2005, where listed companies are identified by a numerical code.

The study found that, consistent with Chinese superstition over the numbers eight and four, newly listed, ostensibly “lucky” shares (that is, with codes that include at least one lucky digit and no unlucky digit) initially traded at a premium.

That “lucky”, however, was found not to be permanent, with the premium dissipating within three years.

As for Singapore, studying the effect of superstition on housing prices in the city offers a good case for measuring the magnitude and economic impact of superstition practices.

In our research, we examined how traditional perceptions of lucky and unlucky numbers — eight and four — affect new sales in the city’s housing market.

Looking at data from almost 50,000 transactions between 2000 and 2009 on the private high-rise and estate market, we found that relatively lower Chinese Singaporeans bought units on floors ending with four.

Moreover, on a per 100 basis, units with numbers ending in four were discounted by 1.1 per cent and units located on the fourth floor were discounted by 0.7 per cent.

Conversely, units with numbers ending in eight commanded a 0.4 per cent premium.
